

I live for the exhilaration that comes from stepping out of my comfort zone to find creative solutions for sophisticated problems. I enjoy writing concise, clean, and efficient code because I believe my work should fall in line with my personality. I take pride in my written and verbal communication skills which I use to ascertain my client's business needs in order to craft their dream website. My background in psychology combined with my business acumen helps me design user experiences that come intuitively for the end user. While I'm fully capable of solo-building complex websites with full database back-end all the way from mock-up to roll-out, I thrive more working in multi-functional, mutually-empowering, culturally-diverse teams.

My degree from UC San Diego isn't in Computer Science, but upon catching the coding bug, the self-starter in me decided it would be a great idea to pursue it regardless. Hence, I have fully enjoyed my time self-learning, as well as attending a Full-Stack Web Development Coding Bootcamp at UCSD Extension. Following that, I carried out an internship at Traffic Roots, where I maintained and updated their advertising platform website applications using (mostly, but not limited to): AngularJS, PHP, Laravel, Bootstrap, Wordpress, jQuery, and MySQL. Nowadays, I attend Computer Science lectures at my alma mater covering fundamentals usually known by CS graduates, while moonlighting as a freelance Web Developer. Please consult my attached resume, and follow the link to my portfolio within. Thank you for your time and consideration.
